Submission Dates

App Design - Monday 10th November end of day.

App Software - Tuesday November 27th at 12 midday

Specification

The purpose of this assignment is to design and develop an Android app. The app can be about anything that you want – but has to include the following skeleton features:

- The app must store data in a local SQLite database
- It must contain an “input” screen where the user has to enter data
- Must include a list (populated with data from the SQLite database)

DT228-3 Mobile Software Development CA

Android App Design and Development Assignment

- Must have underlying operations on the database - i.e. all of INSERT, UPDATE, SELECT, DELETE usage on the database. User login functionality does not count towards this.
- At an absolute minimum, must have *at least* 1 list screen, 1 input screen, 1 extra screen;
- Use at least *two* Android features outside of the above specification. The purpose of this is to demonstrate your proficiency at using the API to discover new features, which you can then implement because you should have built up enough general familiarity with Android to be able to do this. Examples of features might be using the camera API, location services, more creative GUIs using features such as touch input.
- That is the skeleton specification to guide you. Obviously you will have your own programme logic and/or algorithm(s) that support the functionality you want to put in.

What do you have to hand in?

- 1) App Design: A design document in word or pdf
- 2) App S/W : project source code and screen prints :
 - a. Screen prints of your app screens.
 - b. Project Code: Provide a single zipped file containing all directories/files in your Android project. Therefore, all classes, source code, resources, manifest file etc will be included. Include your name in the file name e.g. JohnMurphy.zip .

Please read the notes about code snippets and referencing towards the end of this document.

What is this CA worth of your CA grade?

The app development assignment is worth **30%** of your overall mark in Mobile S/W development. It is marked as follows:

DT228-3 Mobile Software Development CA

Android App Design and Development Assignment

- App source code and demo – marked out of 100.
 - App design - which will be done as a workshop in class during review week. This will be a multiplier on your overall App source code and demo mark (1 if design is done, 0.8 if not completed).
 - Total App mark out of 100= (App source code and demo)* App design multiplier
- Each student must demo their app in the lab as part of the grading.

What needs to be in the Design document

The Design document should specify:

- A sample app design review: that you have looked at - and what design features you like or not about it along the lines of : colour scheme, navigation from screen to screen, ease of use, functionality; The sample app can be any app you use regularly on your phone.
- Your app design: UML Class diagram, screen flows, use cases and database design.

Submit your design document in webcourses as a PDF or .doc titled yourname.xxx .. e.g. JohnMurphy.doc

How will your app code be marked?

Marks for the source code for the app will be as follows.

- **Accuracy/ Completeness (40%)** – for supplying the deliverables listed (working commented code), and for handing in an app that meets the various points in the specification to a high standard.

DT228-3 Mobile Software Development CA

Android App Design and Development Assignment

- **Quality of the user interface (20%)** – Are the screens easy to use? Are they laid out neatly? Do they look viable?
- **Overall quality and complexity of the app (40%)** – Does your app function well and robustly? What extra features beyond the standard functionality requested are included? How complex is it? Here are examples of the types of apps considered basic versus difficult – but don't code these up, use your own idea!:
 - i. An app that allows you to maintain, search and add a set of contacts. It uses a single database table in a local SQLite database. Extra features are some extra UI widgets (use of . DatePicker and menus). This is *basic complexity*, meeting the minimal skeleton specification.
 - ii. An app that stores a list of all schools in the Ireland. Data is held locally in the app. The user can add new schools/ update school descriptions. The list is displayed on a map of Ireland, with the ability to click on an individual school and retrieve information about it and the local area. This includes a calculation of other skills within "X" kilometres of the school, or in the same county. More than one database table in the SQLite database. Solid user interface, credible screens. This is *medium complexity* because the features supplied as medium difficulty (an active map, additional UI widgets), there is some algorithm complexity around calculations and the data is more complex than one or two columns on a single SQLite table).
 - iii. An app that displays and maintains property sales information - Data is stored locally in the app, but property price updates are also scraped regularly from the cloud. The user is able to search by address for particular properties (using reverse geocoding), with extra search functionality on property price comparisons also supplied. The user interface is of a high standard and maximises usability for the user. This is *high complexity* because the extra features are difficult (e.g. web scraping data from the cloud and loading this data into a local database, use of

DT228-3 Mobile Software Development CA

Android App Design and Development Assignment

fragments) , there is algorithmic logic (calculations, price comparisons etc), and the user interface is completely credible.

What sort of app should you develop?

Something of interest to you – it's up to you. Given the specification, you're going to be developing an app that captures information about something (e.g. a sports team, news items, college work, social media,... etc) . . You need to make sure that you include the functionality requested – so your app will have *at least* four or five screens in total.

APPENDIX

Regulations

Late assignments within a week of the due date will be marked out of 50%.

Late assignments more than a week late (without a documented reason) will not be marked.

The app must be your own work. **Assignments that are copied or written by someone else will receive zero marks**, and the plagiarism escalated as per DIT assessment regulations. Note: As described below, **any code snippets used from elsewhere must be referenced using comments in the code or they are treated as plagiarism!**

External Code/ Code snippets

- If you use code snippets that you obtained **from an online or book example**, you **MUST** reference with an opening AND closing comment around the code block itself in the .java file and/or XML file. E.g. for java

```
// Reference: The following code is from  
Android example @www.and.etc
```

DT228-3 Mobile Software Development CA

Android App Design and Development Assignment

```
Intent. I = new Intent (... etc  
// Reference complete
```

If you don't reference code snippets and the code is not yours, it is technically **plagiarised code**. It is not practical to prevent students from using code snippets, but marks will reduce the more you rely on code written by someone else.

- **Follow coding standards** –indented code, comment header blocks for .java files, tidy code, naming standards, appropriate comments etc.- Google's java standards are fine:

<https://google.github.io/styleguide/javaguide.html>
