

Tests, Backtracking, and Recursion

Artificial Intelligence Programming in Prolog
Lecture 3

Lecture 3: Rules, Results, and
Backtracking

1

Re-cap

- A Prolog program consists of **predicate definitions**.
- A predicate denotes a property or relationship between objects.
- Definitions consist of **clauses**.
- A clause has a **head** and a **body** (**Rule**) or **just a head** (**Fact**).
- A head consists of a **predicate name** and **arguments**.
- A clause body consists of a conjunction of **terms**.
- Terms can be **constants**, **variables**, or **compound terms**.
- We can set our program **goals** by typing a command that unifies with a clause head.
- A goal unifies with clause heads in order (top down).
- **Unification** leads to the **instantiation** of variables to values.
- If any variables in the initial goal become instantiated this is reported back to the user.

Lecture 3: Rules, Results, and
Backtracking

2

Correction: Re-trying Goals

- When a question is asked with a variable as an argument (e.g. `greet(Anybody).`) we can ask the Prolog interpreter for multiple answers using: `;`

```
greet(hamish):- write('How are you doin, pal?').
greet(amelia):- write('Awfully nice to see you!').
```

```
| ?- greet(Anybody).
    How are you doin, pal?
    Anybody = hamish? ;
    Awfully nice to see you!
    Anybody = amelia? ;
    no
```

- `;` fails the last clause used and searches down the program for another that matches.
- It then performs all the tasks contained within the body of the new clause and returns the new value of the variable.

Lecture 3: Rules, Results, and
Backtracking

3

Tests

- When we ask Prolog a question we are asking for the interpreter to prove that the statement is true.

```
?- 5 < 7, integer(bob).
yes = the statement can be proven.
no  = the proof failed because either
      • the statement does not hold, or
      • the program is broken.
```

`Error` = there is a problem with the question or program.

`*nothing*` = the program is in an infinite loop.

- We can ask about:
 - Properties of the database: `mother(jane,alan).`
 - Built-in properties of individual objects: `integer(bob).`
 - Absolute relationships between objects:
 - Unification: `=/2`
 - Arithmetic relationships: `<, >, =, >=, =:=, +, -, *, /`

Lecture 3: Rules, Results, and
Backtracking

4

Arithmetic Operators

- Operators for arithmetic and value comparisons are built-in to Prolog
= always accessible / don't need to be written
- Comparisons: `<`, `>`, `=<`, `>=`, `:=` (equals), `=\=` (not equals)
= Infix operators: go between two terms.
= `</2` is used
 - `5 =< 7.` (infix)
 - `=<(5, 7).` (prefix) ← all infix operators can also be prefixed
- Equality is different from unification
= `/2` checks if two terms unify
= `:=/2` compares the arithmetic value of two expressions

<code>?- X=Y.</code>	<code>?- X:=Y.</code>	<code>?-X=4,Y=3, X+2 := Y+3.</code>
yes	Instantiation error	<code>X=4, Y=3? yes</code>

Lecture 3: Rules, Results, and Backtracking

5

Arithmetic Operators (2)

- Arithmetic Operators: `+`, `-`, `*`, `/`
= Infix operators but can also be used as prefix.
 - Need to use `is/2` to access result of the arithmetic expression otherwise it is treated as a term:

<code> ?- X = 5+4.</code>	<code> ?- X is 5+4.</code>
<code>X = 5+4 ?</code>	<code>X = 9 ?</code>
yes	yes
(Can X unify with 5+4?)	(What is the result of 5+4?)

- Mathematical precedence is preserved: `/`, `*`, before `+`, `-`
 - Can make compound sums using round brackets
 - Impose new precedence
 - Inner-most brackets first
- | | |
|---------------------------------|-----------------------|
| <code> ?- X is 5+4*2.</code> | <code>X = 13 ?</code> |
| | yes |
| <code> ?- X is (5+4)*2.</code> | |
| <code>X = 18 ?</code> | |
| yes | |

Lecture 3: Rules, Results, and Backtracking

6

Tests within clauses

- These operators can be used within the body of a clause:

- To manipulate values,

```
sum(X, Y, Sum) :-  
    Sum is X+Y.
```

- To distinguish between clauses of a predicate definition

```
bigger(N,M) :-  
    N < M, write('The bigger number is '), write(M).  
bigger(N,M) :-  
    N > M, write('The bigger number is '), write(N).  
bigger(N,M) :-  
    N == M, write('Numbers are the same').
```

Backtracking

```
|?- bigger(5,4).  
      ↑   ↑   ↑  
bigger(N,M) :-  
    N < M,  
    write('The bigger number is '), write(M).  
bigger(N,M) :-  
    N > M,  
    write('The bigger number is '), write(N).  
bigger(N,M) :-  
    N == M,  
    write('Numbers are the same').
```

Backtracking

```

|?- bigger(5,4).
    ↑   ↑   ↑
bigger(5,4):-
    5 < 4, ← fails
    write('The bigger number is '), write(M).
bigger(N,M):-
    N > M,
    write('The bigger number is '), write(N).
bigger(N,M):-
    N == M,
    write('Numbers are the same').
  
```

Backtrack

Lecture 3: Rules, Results, and Backtracking

9

Backtracking

```

|?- bigger(5,4).
    ↑   ↑   ↑
bigger(N,M):-
    N < M,
    write('The bigger number is '), write(M).
bigger(5,4):-
    5 > 4,
    write('The bigger number is '), write(N).
bigger(N,M):-
    N == M,
    write('Numbers are the same').
  
```

Lecture 3: Rules, Results, and Backtracking

10

Backtracking

```

|?- bigger(5,4).
      ↑   ↑   ↑
      |   |   |
bigger(N,M):-
    N < M.
    write('The bigger number is '), write(M).
bigger(5,4):-
    5 > 4, ← succeeds, go on with body.
    write('The bigger number is '), write(5).
                                     ↑
                                     Reaches full-stop
                                     = clause succeeds

```

The bigger number is 5
yes
|?-

Lecture 3: Rules, Results, and
Backtracking

11

Backtracking

```

|?- bigger(5,5). ← If our query only matches the final clause
      ↑   ↑   ↑
      |   |   |
bigger(N,M):-
    N < M.
    write('The bigger number is '), write(M).
bigger(N,M):-
    N > M,
    write('The bigger number is '), write(N).
bigger(5,5):-
    5 == 5, ← Is already known as the first two clauses failed.
    write('Numbers are the same').

```

Lecture 3: Rules, Results, and
Backtracking

12

Backtracking

`|?- bigger(5,5).` ← If our query only matches the final clause

```

bigger(M,M):-
    N < M,
    write('The bigger number is '), write(M).
bigger(M,M):-
    N > M,
    write('The bigger number is '), write(N).
bigger(5,5):-

```

← Satisfies the same conditions.

`write('Numbers are the same').`

Numbers are the same

yes

Clauses should be ordered according to specificity
Most specific at top ↔ Universally applicable at bottom

Lecture 3: Rules, Results, and
Backtracking

13

Reporting Answers

`|?- bigger(5,4).`

← Question is asked

The bigger number is 5

← Answer is written to terminal

yes

← Succeeds but answer is lost

- This is fine for checking what the code is doing but not for using the proof.

`|?- bigger(6,4), bigger(Answer,5).`

Instantiation error!

- To report back answers we need to
 - put an uninstantiated variable in the query,
 - instantiate the answer to that variable when the query succeeds,
 - pass the variable all the way back to the query.

Lecture 3: Rules, Results, and
Backtracking

14

Passing Back Answers

- To report back answers we need to
 1. put an **uninstantiated variable** in the query,

```
| ?- bigger(6,4,Answer) .
```

```
bigger(X,Y,Answer):- X>Y, Answer=X.  
bigger(X,Y,Answer):- X<Y, Answer=Y.
```

2. instantiate the answer to that variable when the query succeeds,
3. pass the variable all the way back to the query.

Head Unification

- To report back answers we need to
 1. put an **uninstantiated variable** in the query,

```
| ?- bigger(6,4,Answer) .
```

```
bigger(X,Y,X):- X>Y.  
bigger(X,Y,Y):- X<Y.
```

Or, do steps 2 and 3 in one step by naming the variable in the head of the clause the same as the correct answer.

= **head unification**

Satisfying Subgoals

- Most rules contain calls to other predicates in their body. These are known as **Subgoals**.
- These subgoals can match:
 - facts,
 - other rules, or
 - the same rule = a **recursive call**

```

1) drinks(alan,beer).
2) likes(alan,coffee).
3) likes(heather,coffee).

4) likes(Person,Drink):-
    drinks(Person,Drink). ← a different subgoal
5) likes(Person,Somebody):-
    likes(Person,Drink), ← recursive subgoals
    likes(Somebody,Drink). ←
  
```

Lecture 3: Rules, Results, and
Backtracking

17

Representing Proof using Trees

- To help us understand Prolog's proof strategy we can represent its behaviour using **AND/OR trees**.

1. Query is the top-most point (node) of the tree.
2. Tree grows downwards (looks more like roots!).
3. Each branch denotes a subgoal.
 1. The branch is labelled with the number of the matching clause and
 2. any variables instantiated when matching the clause head.
4. Each branch ends with either:
 1. A successful match ○,
 2. A failed match ⊗, or
 3. Another subgoal.

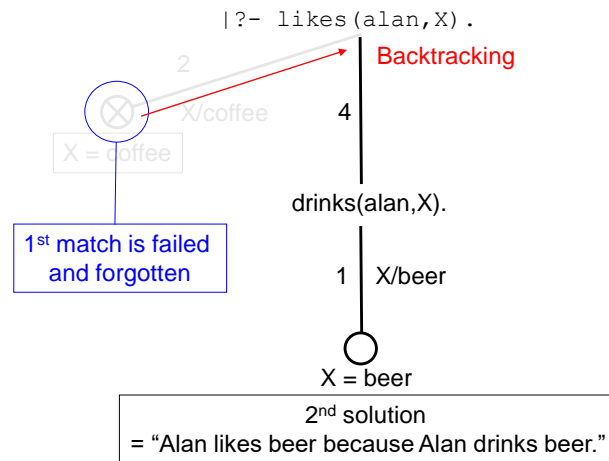

Lecture 3: Rules, Results, and
Backtracking

18

Representing Proof using Trees (2)

- Using the tree we can see what happens when we ask for another match (;)

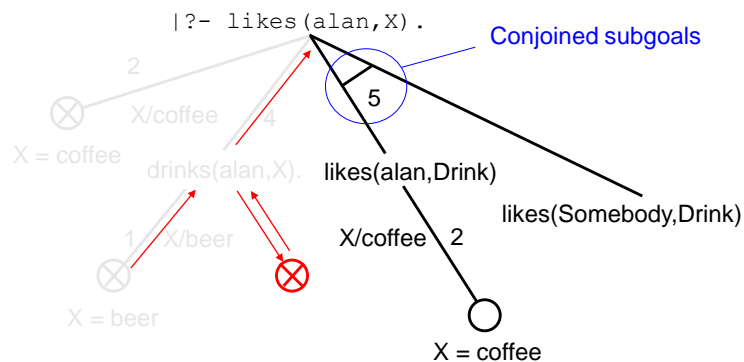

Lecture 3: Rules, Results, and Backtracking

19

Recursion using Trees

- When a predicate calls itself within its body we say the clause is **recursing**

Lecture 3: Rules, Results, and Backtracking

20

Recursion using Trees (2)

- When a predicate calls itself within its body we say the clause is **recursing**

Lecture 3: Rules, Results, and Backtracking

21

Recursion using Trees (3)

- When a predicate calls itself within its body we say the clause is **recursing**

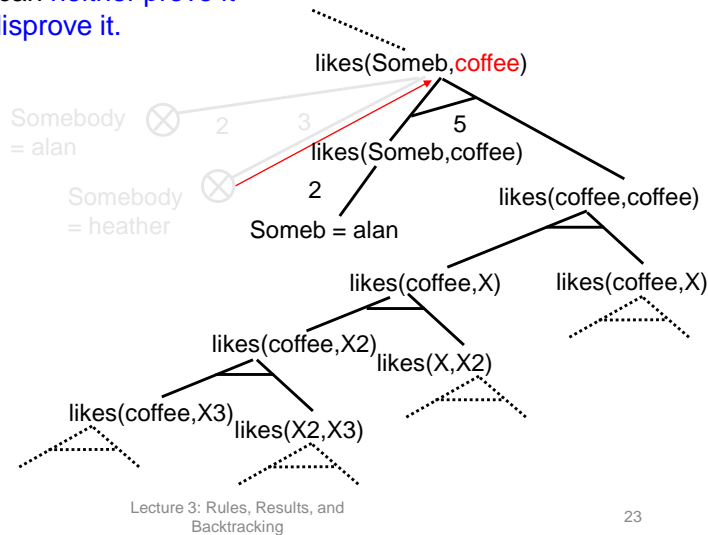

Lecture 3: Rules, Results, and Backtracking

22

Infite Recursive Loop

- If a recursive clause is called with an incorrect goal it will **loop** as it can **neither prove it nor disprove it**.

23

The central ideas of Prolog

- **SUCCESS/FAILURE**
 - any computation can “**succeed**” or “**fail**”, and this is used as a ‘**test**’ mechanism.
 - **MATCHING**
 - any two data items can be compared for similarity, and values can be bound to variables in order to allow a match to succeed.
 - **SEARCHING**
 - the whole activity of the Prolog system is to search through various options to find a combination that succeeds.
 - Main search tools are **backtracking** and **recursion**
 - **BACKTRACKING**
 - when the system fails during its search, it returns to previous choices to see if making a different choice would allow success.
- Prolog’s proof strategy can be represented using AND/OR trees.

Lecture 3: Rules, Results, and Backtracking
